Problem Set 5 Due F Nov 10

1. Evaluate the validity of the following argument using a tree. If the argument is invalid, specify a canonical interpretation from an open branch, and explicitly verify that the interpretation shows the argument invalid. Remember: the procedure for constructing a canonical interpretation differs for trees that involve identity statements.

$$\exists y (Lay \land \neg a = y), Lab : \neg a = b$$

(10)

2. Assess whether the following statement is a logical truth using a tree. If it's not a logical truth, specify a canonical interpretation from an open branch and explicitly verify that the interpretation makes the sentence false.

$$\forall x \forall y \forall z [(\neg x = y \land \neg y = z) \rightarrow \neg x = z]$$

(10)

- 3. Translate the following arguments into QL and assess their validity using a tree. If the argument is invalid, specify a canonical interpretation from an open branch, and explicitly verify that the interpretation shows the argument invalid. *Note: the arguments involve definite descriptions*.
 - (a) The black cat is on the mat. So, some cat on the mat is black.
 - (b) The grey cat is on the mat. So, every cat is on the mat.

(20)

- 4. Take as your domain the set of people. Let Lxy stand for x likes y, Tx stand for x is tall, a = Art, and b = Betty. Symbolize the following sentences.
 - (a) Everyone likes at least one person.
 - (b) Everyone likes at most one person.
 - (c) Everyone likes exactly one person.
 - (d) Everyone likes at least two people.
 - (e) Everyone likes at most two people.
 - (f) Everyone likes exactly two people.
 - (g) Everyone like only themselves [i.e. we like ourselves and no-one else]
 - (h) Everyone likes some other person [i.e. someone other than themself]
 - (i) Some people like only other people [i.e. people other than themself]
 - (j) Only Art likes Betty.
 - (k) The tall person likes Art
 - (I) The person who likes Art likes Betty
 - (m) The person whom Art likes likes Betty.
 - (n) Betty likes the person whom Art likes
 - (o) Art likes tall people

(30)

5. Take as your domain the set of people. Translate (a) - (d) into reasonably natural English (no variables etc.), and translate (e) - (j) into QL using:

<u>Predicates</u>: Gxy = x is a grandparent of y, Pxy = x is a parent of y <u>Functions</u>: fx = fx the father of x; fx = fx the mother of x, fx = fx the son of x <u>Names</u>: fx = fx the father of x and fx the son of x <u>Names</u>: fx = fx the father of x and fx the son of x <u>Names</u>: fx = fx the father of x and fx the son of x <u>Names</u>: fx = fx the son of x <u>Names</u>: fx = fx the father of x and fx the son of x <u>Names</u>: fx = fx th

Please note that in translating (e)-(j) you are restricted to using the predicates and functions listed above.

- (a) $\exists x (x = fj \ v \ x = mj) \rightarrow \exists x Pxj$
- (b) $\neg \exists x P j x \rightarrow \neg \exists x G j x$
- (c) ∃xGffjx
- (d) $\exists x([(Pxj \land \neg x = mj) \land \forall y((Pyj \land \neg y = mj) \rightarrow x = y)] \land x = fj)$
- (e) Laura is Jack's mother
- (f) Laura is a parent of Jack.
- (g) The father of Jack's mother is a grandparent of Jack.
- (h) If Laura is Jack's mother, then Jack is Laura's son
- (i) Jack's mother's mother is not a parent of Jack.
- (j) If Jack has a father, then Jack has a parent
